REVENUE STRATEGY

Revenue Model Report

Commercial hypotheses, staged monetisation and unit economics

REV-05

AAKAASH ADHINAYAK

VAYU NEXA AI | Alchemy Architects | SIH 2026

Prepared 20 October 2026 | Design assessment, not a certification

1. Executive verdict

AAKAASH ADHINAYAK is presently a student-developed prototype concept, and commercial demand has not been validated. The appropriate revenue model is therefore a staged set of hypotheses, not a forecast. Begin with educational and research pilots, then test a civilian maintenance/logistics workflow with one sponsor. Any sensitive public-sector or defence-adjacent engagement would require authorised data, institutional approval, procurement diligence and a security review.

Evidence note: The public URL resolves to a page titled "AAKAASH ADHINAYAK - Verified Intelligence for Adaptive Resource Planning", but the available research interface did not expose navigable page text, runtime interactions, source code, API traces or test results. Therefore this report distinguishes observed deployment metadata and the team-supplied blueprint from proposed design and unverified implementation. It is not a source-code audit, security assessment, or certification of the live system.

2. Candidate business models

Model	Payer / buyer	Product offer	When appropriate
Academic / lab licence	University, lab or training centre	Research sandbox, scenario packs, instructor features and support.	After a successful teaching/research pilot.
Pilot implementation fee	Civilian logistics / maintenance organisation	Defined data integration, workflow configuration and evaluation report.	After a sponsored pilot scope and measurable outcomes.
Annual SaaS subscription	Organisation with recurring workflow	Hosted service with role controls, audit exports, support and version updates.	Only when repeat usage, hosting/security needs and willingness to pay are proven.
Enterprise/on-prem deployment	Larger organisation or regulated customer	Private deployment, integration adapters, access controls and support.	Later stage; higher assurance and maintenance burden.
Training and support	Lab, institution or customer	Workshops, onboarding, scenario design, technical support.	Can complement other models but should not imply proprietary certification.
Research collaboration	Academic or grant-funded sponsor	Joint experiments, open benchmarks and domain-specific evaluation.	Good early path when the software is not yet mature enough for SaaS.

3. Recommended staged revenue path

Stage A - Free demonstrator and proof assets

Publish a bounded demo with synthetic generic test records and a clearly separated public-data experiment. Use it to obtain feedback and to make the solver, validator, dataset sources and measurement protocol inspectable. Do not charge users for a prototype whose data lineage and reliability are still unverified.

Stage B - Paid discovery or a supported educational pilot

Offer a fixed-scope engagement to configure a dataset, define a scheduling problem, run baseline comparisons and deliver a measured report. Scope, deliverables, data responsibilities and acceptance criteria should be contractual. This is often simpler to validate than pricing a broad platform.

Stage C - Recurring subscription

Only consider recurring SaaS once a user group runs the workflow repeatedly and a buyer can identify an operational budget. Potential package differences can reflect users, datasets/connectors, storage/retention, audit, support and deployment environment. Exact rupee prices should be set after interviews and cost estimation, not fabricated in this report.

Stage D - Enterprise and public sector

A dedicated deployment may need identity integration, private networking, data residency decisions, audit exports, security testing, service-level objectives, support, incident response and procurement documentation. This cost profile differs materially from a student demo. Any defence-adjacent use would require appropriate authorisation and should not be implied by the current app.

4. Pricing discovery and unit economics

No defensible price point is currently available from the supplied evidence. Use buyer interviews and paid pilot offers to discover willingness to pay. For a hosted service, estimate monthly cost from compute, database operations, network egress, storage/backups, external API calls, LLM tokens, observability and support. Cloud Run billing is usage-sensitive and region-dependent [R12][R13]; model/API and Firebase costs must be estimated separately using current official pricing.

Economic variable	Example content	Evidence to collect
Monthly recurring revenue (MRR)	Sum of active subscription values per month.	Signed recurring contracts; exclude free pilots and verbal interest.
Gross margin	(Revenue - directly attributable service cost) / revenue.	Hosting, data, model API, storage and directly attributable support cost.
Cost to serve	Per customer usage cost + support effort + integration amortisation.	Usage telemetry and time-tracked support/integration.
Customer acquisition cost	Sales/marketing effort and expense divided by acquired paying customers.	Track labour/time as well as cash spending.
Payback period	Acquisition cost divided by monthly contribution margin.	Only calculate after reliable customer and margin data exist.
Pilot conversion	Paid/renewed pilots divided by completed pilots.	Signed conversion and renewal records.

5. Illustrative pricing architecture, not a price quote

Tier hypothesis	Possible limits	Value-based pricing
Education / research	Fixed number of users, synthetic scenarios, public data and local export.	Demonstrated teaching value and support burden.
Team / pilot	Multiple users, approved data adapters, evidence ledger and onboarding.	Pilot sponsor agrees on measurable outcome and acceptance tests.
Professional hosted	Roles, recurring history, monitored connectors, support and backups.	Repeat use, cost-to-serve and willingness to pay validated.
Private enterprise	Private deployment, custom integration, advanced identity and contractual support.	Security/procurement requirements and support cost fully scoped.

6. Revenue and compliance risks

- Do not represent MoD, Defence Services Staff College or any government body as a customer, endorser or data provider without documented authorisation.
- Do not sell an implication of live military readiness, weapon planning, tactical routing or defence-system integration. The current product is a non-operational student prototype.
- Do not promise model accuracy, time savings or financial returns before measurements exist.
- Recheck third-party dataset rights, API conditions, model terms and retention obligations before each commercial use.
- Build a clear software maintenance plan, incident process, backups, version support and responsibility boundaries before charging for a hosted service.

- Keep a separate cost ledger for model calls; unbounded AI use can produce variable cost and rate-limit problems.

7. Revenue model recommendation

Recommendation: Treat the next milestone as research validation, not immediate monetisation. After the working prototype passes acceptance tests, target one academic/lab pilot and one narrow civilian maintenance/logistics discovery pilot. Charge for a defined outcome and technical service first; consider subscription pricing only after recurring usage and unit economics are demonstrated.
